ABSTRACT: Cloud computing is a technology, which provides low cost, scalable computational capacity. The storage and access of document have been major problem in this area. While, many schemes have been proposed to perform conjunctive keyword search, less attention has been noted. In this paper, we present a phrase search technique based on bloom filters, which is faster than existing system. Our techniques uses conjunctive keyword search to support functionalities. This approach also described the false positive rate.

KEYWORDS: Phrase Search, Conjunctive Keyword Search, Bloom Filters, False Positive Rate, Hashing

I.INTRODUCTION

Cloud computing has generated much interest in the research community in recent years to search over encrypted documents stored on cloud many schemes has been proposed but less attention have been noted on more search techniques. To overcome the storage and access of confidential documents stored in cloud.we proposed a phrase search using bloom filters which is faster than existing system.our techniques uses an conjunctive keyword which is drawback of existing system to get the stored document faster and access secure This approach also described the false positive rate for the keyword search.

II .RELATED WORK

Boneh et al. proposed one of the earliest works on keyword searching. Their scheme uses public key encryption to allow keywords to be searchable without revealing data content. Waters et al. investigated the problem for searching over encrypted audit logs. Many of the early works focused on single keyword searches. Recently, researchers have proposed solutions on conjunctive keyword search, which involves multiple keywords. Other interesting problems, such as the ranking of search results and searching with keywords that might contain errors termed fuzzy keyword search, have also been considered. The ability to search for phrases was also recently investigated. The ranking of search results was looked at by Wang. The authors described a solution based on the commonly used TFIDF (Term Frequency X Inverse Document Frequency) rule and the use of order preserving symmetric encryption. Liuet considered the search for potentially erroneous keywords termed fuzzy keyword search. The index-based solution makes use of fuzzy dictionaries containing various misspelling of keywords including wildcards. Some of the existing system has examined the security of the proposed solutions and, where flaws were found, solutions were proposed.

III .PROPOSED SYSTEM

OBJECTIVE:

- To reduced the search time
- To enable the multi keyword search over cloud data

(A High Impact Factor, Monthly, Peer Reviewed Journal)

Vol. 6, Issue 3, March 2018

SCOPE:

- The scheme is also scalable, where documents can easily be removed and added to the corpus.
- We also describe modifications to the scheme to lower storage cost at a small cost in response time and to defend against cloud providers with statistical knowledge on stored data.

Fig.1: Proposed system architecture.

IV .METHODOLOGY & DISCUSSION

In this approach we used three methodology which is used to retrieve data from cloud fast and secure .The algorithm and protocol is used to encrypt the files and keyword and took the value for all keywords and file to decrypt the file faster stored in the cloud server.Here we using an realtime cloud Drive HQ to store document

- AES ALGORITHM
- TDES ALGORITHM
- HASHING

MODULES:

- System Framework
- Data Owner
- Data User
- Cloud Server

MODULES DISCUSSION:

System Framework: In this framework, we designed a standard keyword search protocol. During setup, the data owner generates the required encryption keys for hashing and encryption operations. Then, all documents in the database are parsed for keywords. Bloom filters tied to hashed keywords and n-grams are attached. The documents are then symmetrically encrypted and uploaded to the cloud server. To add files to the database, the data owner parses the files as in setup and uploads them with Bloom filters attached to the cloud server. To remove a file from the data, the data

Vol. 6, Issue 3, March 2018

owner simply sends the request to the cloud server, who removes the file along with the attached Bloom filters. To perform a search, the data user enters keyword then it computes and sends a trapdoor encryption of the queried keywords to the cloud to initiate a protocol and returns accurate file. Here we implement some modules they are Data Owner, Data User and Cloud Server.

Data Owner:In Data Owner module, Initially Data Owner must have to register their detail and after login he/she has to verify their login through OTP. Then data Owner can upload files into cloud server with encrypted keywords and hashing algorithms. He/she can view the files that are uploaded in cloud. Data Owner can approve or reject the file request sent by data users.

Data User: In Data User module, Initially Data Users must have to register their detail and then login into cloud. Data Users can search all the files upload by data owners. He/she can send request to the files and then request will send to the data owners. If data owner approve the request then he/she will receive the decryption key in registered mail

Cloud Server:In this module, we develop Cloud Server module. In Cloud Server module, Cloud Provider can view all the Data owners and data users' details. CP can able see the files in cloud uploaded by the data owners.

V.EXPERIMENTAL RESULTS

Dataowner should login to the cloud server to upload files in the cloud. While Register is done the OTP sends to the owner mail. When the OTP is verified then the home page of Data Owner will be displayed.

V .CONCLUSION AND FUTURE WORK

In this paper, we presented a phrase search scheme based on Bloom filter that is significantly faster than Existing approaches, requiring only a single round of communication and Bloom filter verifications. Our approach is also the first to effectively allow phrase search to run independently without first performing a conjunctive keyword search to identify candidate documents. The technique of constructing a Bloom filter index enables fast verification of Bloom filters in the same manner as indexing. According to our experiment, it also achieves a lower storage cost than all existing solutions except where a higher computational cost was exchanged in favor of lower storage. While exhibiting similar communication cost to leading existing solutions, the proposed solution can also be adjusted to achieve maximum speed or high speed with a reasonable storage cost depending on the application.
