ABSTRACT: Now a day's online payment gaining popularity because of easy and convenience use of ecommerce. It became very easy mode of payment. People choose online payment and e-shopping; because of time convenience, transport convenience, etc. As the result of huge amount of e-commerce use, there is a vast increment in credit card fraud also. Machine Learning has been successfully applied to finance databases to automate analysis of huge volumes of complex data. Machine Learning has also played a salient role in the detection of credit card fraud in online transactions. Fraud detection in credit card is a big problem, it becomes challenging due to two major reasons—first, the profiles of normal and fraudulent behaviors change frequently and secondly due to reason that credit card fraud data sets are highly skewed. This paper research and checks the performance of Random Forest on highly skewed credit card fraud data. Dataset of credit card transactions is sourced from European cardholders containing 1 lakh transactions. These techniques are applied on the raw and pre processed data. The performance of the techniques is evaluated based on accuracy, sensitivity, and specificity, precision.

KEYWORDS: Data Analysis, Fraud in credit card, Random Forest, Machine Learning, Security.

I. INTRODUCTION

Credit card fraud is a growing concern with far reaching consequences in the government, corporate organizations, finance industry, In Today's world high dependency on internet technology has enjoyed increased credit card transactions but credit card fraud had also accelerated as online and offline transaction. As credit card transactions become a widespread mode of payment, focus has been given to recent computational methodologies to handle the credit card fraud problem. There are many fraud detection solutions and software which prevent frauds in businesses such as credit card, retail, e-commerce, insurance, and industries. Machine Learning is one notable and popular methods used in solving credit fraud detection problem. It is impossible to be sheer certain about the true intention and rightfulness behind an application or transaction. In reality, to seek out possible evidences of fraud from the available data using mathematical algorithms is the best effective option. Fraud detection in credit card is the truly the process of identifying those transactions that are fraudulent into two classes of legit class and fraud class transactions, several techniques are designed and implemented to solve to credit card fraud detection such as genetic algorithm, artificial neural network frequent item set mining, migrating birds optimization algorithm, comparative analysis of decision tree and random forest is carried out.

Firstly, data sets are not easily accessible for public and the results of researches are often hidden and censored, making the results inaccessible and due to this it is challenging to benchmarking for the models built. Lastly, the data sets are continuously evolving and changing making the profiles of normal and fraudulent behaviors always different that is the legit transaction in the past may be a fraud in present or vice versa. This paper evaluates two advanced machine learning, Decision tree and random forests and then a collative comparison is made to evaluate that which model performed best. Credit card transaction datasets are rarely available, highly imbalanced and skewed.

II. LITERATURE REVIEW

In [1] this document proposes a new comparative measure of the comparison rules that reasonably represents the profits and losses due to fraud detection. A cost-sensitive method based on the minimum Bayes risk is presented using the proposed cost measure. Improvements of up to 23% are obtained by comparing this method and other latest-generation

| e-ISSN: 2320-9801, p-ISSN: 2320-9798| <u>www.ijircce.com</u> | [Impact Factor: 8.379 | Monthly Peer Reviewed & Referred Journal | || Volume 12, Issue 4, April 2024 ||

| DOI: 10.15680/IJIRCCE.2024.1204202 |

algorithms. The data set for this document is based on the real-life transactional data of a large European company and personal data in the data is kept confidential.

In [2] Several modern techniques based on sequence alignment, machine learning, artificial intelligence, genetic programming, data mining, etc. They have been developed and are still being developed to detect fraudulent credit card transactions. A solid and clear understanding of all these approaches is needed, which will undoubtedly lead to an efficient credit card fraud detection system.

In [3] A comparison was made between models based on artificial intelligence together with a general description of the fraud detection system developed in this document, such as the naive Bayesian classifier and the Bayesian network model, the clustering model. And finally, conclusions are drawn on the results of the model evaluation tests. The number of legal truncation was determined to be greater than or equal to 0.65, ie its accuracy was 65% using the Bayesian network.

In [4] Nutan and Suman on review on credit card fraud detection they have supported the theory of what is credit card fraud, types of fraud like telecommunication, bankruptcy fraud etc. and how to detect it, in addition to it they have explained numerous algorithms and methods on how to detect fraud using Glass Algorithm, Bayesian, networks, Hidden Markova model, Decision Tree and 4 more.

III. PROPOSED APPROACH

In this system evidences from current as well as past Behaviour are combined. A fraud detection system is proposed that includes rule based filter, Dempster Shafer adder, transaction history database and Bayesian learner. In rule base the suspicion level of each incoming transaction is determined. Dumpster Shafer is used to combine multiple such evidences and an initial belief is computed. Based on this belief the transactions are classified as normal, abnormal or suspicious. The incoming transactions are initially handled by the rule base using probability values. After this the values are combined using Dumpster Shafer Adder. If the transaction is declared as fraudulent then it is handled by the card holder. If suppose the transaction is suspicious then it is fed in the suspicious table. The score of transaction is updated in the database with the help of machine learning classification. This architecture is flexible such that new kinds of fraud can be handled easily. With the help of learner the system can dynamically adapt to the changing needs.

V. CONCLUSION

Credit card fraud detection is a fascinating domain. From this survey, we analyze that machine learning is the best compared to forecasting and classification. Machine learning techniques are mainly preferred in fraud detection, due to their high accuracy and detection rate. Even so, researchers find it difficult to achieve greater accuracy and detection speed. In addition, organizations are interested in finding ways to reduce costs and increase profits; you can find and select the method of previous studies.
