# A Review on LI-FI Technology

Mamadakbar Kumbhar, Prof.Pratibha Adkar

Department of MCA, Modern College of Engineering, Pune, Maharashtra, India

**ABSTRACT:** Li-Fi stands for Light Fidelity. The technology is very new and was proposed by the German physicist Harald Haas in 2011 TED (Technology, Entertainment, Design) Global Talk on Visible Light Communication (VLC).Li-Fi is a wireless optical networking technology that uses light emitting diodes (LEDs) for transmission of data. The term Li-Fi refers to visible light communication (VLC) technology that uses light as medium to deliver high-speed communication in a manner similar to Wi-Fi and complies with the IEEE standard IEEE 802.15.7. The IEEE 802.15.7 is a high-speed, bidirectional and fully networked wireless communication technology based standard similar to Wi-Fi's IEEE 802.11.

KEYWORDS: Li-Fi, Visible Light Communication, Transmission, Radio Spectrum.

# I. INTRODUCTION

Now-a-days, internet has become a major demand people are in search of Wi-Fi hot spots. Li-fi or Light Fidelity was invented by professor Harald Hass of university of Edinburgh. This is the latest technology in present day communication system which makes the use of LEDs, Light Emitting Diodes that helps in the transmission of data much faster and flexible than the data that can be transmitted through Wi-Fi. It is basically a 5G technology of visible light communication system which utilizes light emitting diodes as a medium of high speed communication in similar manner as Wi-Fi.

This idea works very simply, if the LED is on then logic "1" will be transmitted and if the led is off then logic "0" will be transmitted also, LEDs can be switched on and off very quickly which adds onto another advantage.

# II.SHORTCOMINGS OF RADIO WAVES TRANSMISSION

#### 1 issues with radio waves:

a) **Capacity:** Wireless data is transmitted through radio waves which are limited and expensive. It has a limited bandwidth, vis-à-vis Li-Fi. With the rapidly growing world and development of technologies like 3G, 4G and so on we are running out of radio spectrum.

b) **Energy Efficiency:** There are a large number of cellular radio base stations that consume massive amount of energy. Most of the energy is used for cooling down the base station instead of transmission. Therefore, efficiency of such Radio base stations is very low.

c) Availability: Availability of radio waves is a big concern. Further, Radio waves are not advisable to be used in aeroplanes and at places where radio interference may cause undesirable/catastrophic result.

d) **Security:** Radio waves can penetrate through walls. They can be intercepted. If someone has knowledge and bad intentions, they may misuse it. This causes a major security concern for Wi-Fi.

# 2 Why Visible Light Communication

The frequency spectrum that is available to us in the atmosphere consists of many wave regions like X-rays, gamma rays, u-v region, infrared region, visible light rays, radio waves, etc. Any one of the above waves can be used in the upcoming communication technologies but why the Visible Light part is chosen? The reason behind this is the easy availability and lesser harmful effects that occur due to these rays of light. VLC uses the visible light between 400 THz (780 nm) and 800 THz (375 nm) as medium which are less dangerous for high-power applications and also humans can easily perceive it and protect themselves from the harmful effects whereasthe other wave regions have following disadvantages:

- Radio waves are expensive (due to spectrum charges) and less secure (due to interference and possible interception etc.)
- Gamma rays are harmful because it could be dangerous dealing with it, by the human beings due to their proven adverse effects on human health.

| e-ISSN: 2320-9801, p-ISSN: 2320-9798| <u>www.ijircce.com</u> | |Impact Factor: 7.542 |

|| Volume 9, Issue 6, June 2021 ||

| DOI: 10.15680/IJIRCCE.2021.0906060 |

- X-rays have health issues, similar to the Gamma Rays.
- Ultraviolet light can be considered for communication technology purposes at place without people, otherwise they can also be dangerous for the human body when exposed continuously.
- Infrared, due to high safety regulation, can only be used with low power.

Hence the Visible light portion (from red to blue) of the electromagnetic spectrum does not cause any harm to the people as visible rays are safe to use, provide larger bandwidth and also have a promising future in the communication field.

# 3 Comparison Between Li-Fi and, Wi-Fi and other Radio Communication Technologies

Both Wi-Fi and Li-Fi can provide wireless Internet access to users, and both the technologies transmit data over electromagnetic spectrum. Li-Fi is a visible light communication technology useful to obtain high speed wireless communication. The difference is: Wi-Fi technology usesradio waves for transmission, whereas Li-Fi utilizes light waves. Wi-Fi works well for generalwireless coverage within building/campus/compound, and Li-Fi is ideal for high densitywireless data coverage inside a confined area or room and is free from interference issues unlikethe Wi-Fi.Table I shows a comparison of transfer speed of various wireless technologies. Table II shows a comparison of Li-Fi with Wi-Fi.

Table 1: Comparison of speed of various wireless technologies

Technology	Speed
Li-Fi	~1 Gbps
Wi-Fi-IEEE 802.1 In	~150 Mbps
IrDa	~4Mbps
Bluetooth	~3Mbps
NFC	~424Kbps

Spectrum Used Visible Light RF	Spectrum Used Visible Light RF	Spectrum Used Visible Light RF

Cost Low High	Cost Low High	Cost Low High

# Table 2: Comparison of Wi-Fi and Li-Fi

# II. ARCHITECTURE OF LI-FI

Li-Fi which can be the future of data communication appears to be a fast and cheap optical version of Wi-Fi. Being a Visible Light Communication (VLC), Li-Fi uses visible light of electromagnetic spectrum between 400 THz and 800 THz as optical carrier for data transmission and illumination. It uses fast pulses of light to transmit information in wireless medium. The main components of a basic Li-Fi system may contain the following:

a) A high brightness white LED which acts as transmission source.

b) A silicon photodiode with good response to visible light as the receiving element.

Turning the LEDs on and off can make them generate digital strings with different combination of 1s and 0s. To generate a new data stream, data can be encoded in the light by varying the flickering rate of the LED. In this way, the LEDs work as a transmitter by modulating the light with the data signal. The LED output appears constant to the human because they are made to flicker at a phenomenal speed (millions of times per second) and it's impossible for human eye to detect this frequency. Communication rate more than 100 Mbps can be achieved by using high speed LEDs with the help of various multiplexing techniques. And this VLC data rate can be further increased to as high as 10 Gbps via parallel data transmission using an array of LED lights with each LED transmitting a different data stream.

| e-ISSN: 2320-9801, p-ISSN: 2320-9798| <u>www.ijircce.com</u> | |Impact Factor: 7.542 |

|| Volume 9, Issue 6, June 2021 ||

| DOI: 10.15680/IJIRCCE.2021.0906060 |

The Li-Fi transmitter system consists of four primary subassemblies:

- Bulb
- RF Power Amplifier Circuit (PA)
- Printed Circuit Board (PCB)
- Enclosure

The Printed circuit board (PCB) controls the electrical inputs and outputs of the lamp and houses the microcontroller used to manage different lamp functions. A Radio Frequency (RF) signal is generated by the Power Amplifier and is directed into the electric field of the bulb. As a result of the high concentration of energy in the electric field, the contents of the bulb will get vaporized into a plasma state at the bulb's centre. And this controlled plasma in turn will produce an intense source of light. All of these subassemblies are contained in an aluminium enclosure as shown in Fig. 1 above.

## III. WORKING OF LI-FI

#### **1 Basic Concept:**

Light Fidelity (Li-Fi) technology is a wireless communication system based on the use of visiblelight between the violet (800 THz) and red (400 THz). Unlike Wi-Fi which uses the radio partof the electromagnetic spectrum, Li-Fi uses the optical spectrum i.e. Visible light part of theelectromagnetic spectrum. The principle of Li-Fi is based on sending data by amplitudemodulation of the light source in a well-defined and standardized way. LEDs can be switchedon and off faster than the human eyes can detect since the operating speed of LEDs is less than1 microsecond. This invisible on-off activity enables data transmission using binary codes. If the LED is on, a digital '1' is transmitted and if the LED is off, a digital '0' is transmitted. Alsothese LEDs can be switched on and off very quickly which gives us a very nice opportunity fortransmitting data through LED lights, because there are no interfering light frequencies like thatof the radio frequencies in Wi-Fi. Li-Fi is thought to be 80% more efficient, which means it canreach speeds of up to 1Gbps and even beyond. Li-Fi differs from fibre optic because the Li-Fiprotocol layers are suitable for wireless communication over short distances (up to 10 meters). This puts Li-Fi in a unique position of extremely fast wireless communication over short distances.

Fig 2: Li-Fi Transmission.

#### 2 How it Works:

The working of Li-Fi is very simple. There is a light emitter on one end i.e. an LED transmitter, and a photo detector (light sensor) on the other. The data input to the LED transmitter is encoded in to the light (technically referred to as Visible Light Communication) by varying the flickering rate at which the LEDs flicker 'on' and 'off' to generate different strings of 1s and 0s. The on off activity of the LED transmitter which seems to be invisible (The LED intensity is modulated so rapidly that human eye cannot notice, so the light of the LED appears constant to humans), enables data transmission in light form in accordance with the incoming binary codes: switching ON a LED is a logical '1', switching it OFF is a logical '0'. By varying the rate at which the LEDs flicker on and off, information can be encoded in the light to different combinations of 1s and 0s.In a typical setup, the transmitter (LED) is connected to the data network (Internet through themodem) and the receiver (photo detector/light sensor) on the receiver. The receiver (photo detector) registers a binary '1' when the transmitter (LED) isON and a binary '0' when the transmitter (LED) is OFF. Thus flashing the LED numerous timesor using an array of LEDs (perhaps of a few different colours) will eventually provide data rates the range of hundreds of Mbps. The Li-Fi working is explained in a block diagram (Fig.3).

Fig 3: Block diagram of Li-Fi Sub System.

Hence all that is required, is some or an array of LEDs and a controller that controls/encodesdata into those LEDs. All one has to do is to vary the rate at which the LEDs flicker dependingupon the data input to LEDs. Further data rate enhancements can be made in this method, byusing array of the LEDs for parallel data transmission, or using mixtures of red, green and blueLEDs to alter the light's frequency, with each frequency encoding a different data channel.Figure 4 shows working/deployment of a Li-Fi system connecting the devices in a room.

# **IV.ADVANTAGES AND LIMITATION OF LI-FI**

# 1 Advantages:

a) Efficiency: Energy consumption can be minimised with the use of LED illuminationwhich are already available in the home, offices and Mall etc. for lighting purpose. Hencethe transmission of data requiring negligible additional power, which makes it very efficient in terms of costs as well as energy.

b) High speed: Combination of low interference, high bandwidths and high-intensityoutput, help Li-Fi provide high data rates i.e. 1 Gbps or even beyond.

c) Availability: Availability is not an issue as light sources are present everywhere. Wherever there is a light source, there can be Internet. Light bulbs are present everywhere– in homes, offices, shops, malls and even planes, which can be used as a medium for thedata transmission.

d) Cheaper: Li-Fi not only requires fewer components for its working, but also uses only anegligible additional power for the data transmission.

e) Security: One main advantage of Li-Fi is security. Since light cannot pass through opaquestructures, Li-Fi internet is available only to the users within a confined area and cannotbe intercepted and misused, outside the area under operation.

f) Li-Fi technology has a great scope in future. The extensive growth in the use of LEDsfor illumination indeed provides the opportunity to integrate the technology into aplethora of environments and applications.

# 2 Limitation:

Some of the major limitations of Li-Fi are:

- Internet cannot be accessed without a light source. This could limit the locations and
- situations in which Li-Fi could be used.
- It requires a near or perfect line-of-sight to transmit data
- Opaque obstacles on pathways can affect data transmission
- Natural light, sunlight, and normal electric light can affect the data transmission speed
- Light waves don't penetrate through walls and so Li-Fi has a much shorter range than Wi-Fi
- High initial installation cost, if used to set up a full-fledged data network.
- Yet to be developed for mass scale adoption.

# V.APPLICATIONS OF LI-FI

**a**)**Education systems:** Li-Fi is the latest technology that can provide fastest speed forInternet access. So, it can augment/replace Wi-Fi at educational institutions and atcompanies so that the people there can make use of Li-Fi with the high speed.

**b)Medical Applications:** Operation theatres (OTs) do not allow Wi-Fi due to radiationconcerns. Usage of Wi-Fi at hospitals interferes/blocks the signals for monitoringequipment's. So, it may have hazardous effect to the patient's health, due to improperworking of medical apparatus. To overcome this and to make OT tech savvy Li-Fi canbe used to access internet and also to control medical equipment's. This will be beneficial for conducting robotic surgeries and other automated procedures.

| e-ISSN: 2320-9801, p-ISSN: 2320-9798| www.ijircce.com | |Impact Factor: 7.542 |

|| Volume 9, Issue 6, June 2021 ||

| DOI: 10.15680/IJIRCCE.2021.0906060 |

c) Cheaper Internet in Aircrafts: The passengers travelling in aircrafts get access to lowspeed Internet that too at a very high price. Also Wi-Fi is not used because it may interfere with the navigational systems of the pilots. In aircrafts Li-Fi can be used for datatransmission. Li-Fi can easily provide high speed Internet via every light source such asoverhead reading bulb, etc. present inside the airplane.

d) Underwater applications: Underwater ROVs (Remotely Operated Vehicles) operatefrom large cables that supply their power and allow them to receive signals from theirpilots above. But the tether used in ROVs is not long enough to allow them to explorelarger areas. If their wires were replaced with light — say from a submerged, high poweredlamp — then they would be much freer to explore. They could also use their headlamps to communicate with each other, processing data autonomously and sending their findings periodically back to the surface. Li-Fi can even work underwater where Wi-Fi fails completely, thereby throwing open endless opportunities for military underwater operations.

e) **Disaster management:** Li-Fi can be used as a powerful means of communication in timesof disaster such as earthquake or hurricanes. The average people may not know theprotocols during such disasters. Subway stations and tunnels, common dead zones formost emergency communications, pose no obstruction for Li-Fi.

**f**) **Applications in sensitive areas:** Power plants need fast, inter-connected data systems sothat demand, grid integrity and core temperature (in case of nuclear power plants) can bemonitored. The Radio communication interference is considered to be bad for such sensitive areas surrounding these power plants. Li-Fi can offer safe, abundant connectivity for all areas of these sensitive locations. Also, the pressure on a power plant's own reserves (power consumption for Radio communications deployments) will be lessened.

**g**) **Traffic management:** In traffic signals Li-Fi can be used to communicate with passingvehicles (through the LED lights of the cars etc.) which can help in managing the trafficin a better manner resulting into smooth flow of traffic and reduction in accidentnumbers. Also, LED car lights can alert drivers when other vehicles are too close.

**h**) **Mobile Connectivity:** Mobiles, laptops, tablets, and other smart phones can easilyconnect with each other. The short-range network of Li-Fi can yield exceptionally highdata rates and higher security.

**i**) **Replacement for other technologies:** Li-Fi doesn't work using radio waves. So, it can beeasily used in the places where Bluetooth, infrared, Wi-Fi, etc. are banned.

**j**)**Li-Fi for smart cities:** The simplicity on the li-fi technology using LED lamps to transmit data, including high speed data connections that could be served from street lights could boost emergence of smart locations.

**k. Reliable communication and improved networking in a Li-Fi network:** Li-Fi is a high-speed, bi-directional and fully networked broadband wireless technology that's aimed at offloading the present Wi-Fi technology. A Li-Fi access level can serve multiple users simultaneously inside the area of its insurance coverage, and this is called as optical at to cell.

**l. Light brings users super-fast wireless internet:** Lighting in shop windows, cars and classrooms can often access the wireless web. Li-Fi could prove to get seven times faster than Wi-Fi as well as enable to download a complete HD movie in several seconds.

# IV. FUTURE SCOPE

As light is everywhere and free to use, there is a great scope for the use and evolution of Li-Fi. technology. If this technology becomes mature, each Li-Fi bulb can be used to transmit wireless data. As the Li-Fi technology becomes popular, it will lead to a cleaner, greener, safer communications and have a bright future and environment. The concept of Li-Fi is deriving many people as it is free (require no license) and faster means of data transfer. If it evolves faster, people will use this technology more and more.

| e-ISSN: 2320-9801, p-ISSN: 2320-9798| www.ijircce.com | |Impact Factor: 7.542 |

|| Volume 9, Issue 6, June 2021 ||

| DOI: 10.15680/IJIRCCE.2021.0906060 |

## 8.1 Li-Fi Roadmap:

Fig 5: Li-Fi Roadmap.

Currently, LBS (location Based Service) or Broadcast solution are commercially available. The next step could be a Li-Fi WLAN for B2B market with high added value on specific business cases and could grow towards mass market. In the long term, the Li-Fi could become an alternative solution to radio for wireless high data rate room connectivity and new adapted service, such as augmented or virtual reality.

# **V.CONCLUSION**

Although there's still a long way to go to make this technology a commercial success, it

promises a great potential in the field of wireless internet. A significant number of researchers and companies are currently working on this concept, which promises to solve the problem of lack of radio spectrum, space and low internet connection speed. By deployment of this technology, we can migrate to greener, cleaner, safer communication networks. The very concept of Li-Fi promises to solve issues such as, shortage of radio-frequency bandwidth and eliminates the disadvantages of Radio communication technologies.

Li-Fi is the upcoming and growing technology acting as catalyst for various other developing and new inventions/technologies. Therefore, there is certainty of development of future applications of the Li-Fi which can be extended to different platforms and various walks of human life.
